

5100 Series

Cracking & Reseal Pressure

Definitions

1. *Cracking pressure* is defined as 5cc/min with gas (0.2 scfm for 5120 Series)
2. *Reseat point* is the point at which the valve closes, cutting off virtually all flow.
3. The *reseal point* is the point at which the valve seals absolutely tight so that there is no leakage detectable by normal means of measurement.
